

Hackathon Operations

SUBMISSION AND REVIEW PROCESS

Day 2 Timeline & Submission Review Guide

Saturday, 17 October: code submission, technical review, and demo/presentation upload process.

Code submission closes at 11:00. Uploads close at 12:00.

SUBMISSION PROCESS»

Day 2 Timeline & Submission Review Guide

In this part >

Day 2 schedule	4
Submission & review process	4
Step by step	5

Day 2 schedule

Time	Activity
11:00 – 12:00	All final code submitted into the GitHub public repositories by 11:00. Demo videos and presentations uploaded between 11:00 – 12:00. Code review for each project. Participants practice presentations.
12:00 – 13:00	Presentations submitted and Round 1 judging (first floor, hack rooms)

Submission & review process

11:00 – 12:00

Code submission closes at 11:00. From that point, review runs in parallel across two tracks so that code, demos, and presentations are all checked before Round 1 judging begins at 12:00.

11:00

Code submission
deadline

11–12

Code review, demo review
and presentation deck review,
in parallel

12:00

Uploads close at 12:00

Step by step

1

Step

11:00

Code submission deadline

All teams push their final code into their GitHub public repository. No further code changes after this point.

Follow these steps to submit your project.

- 1 Make your GitHub repository public.** Your code needs to be visible to the reviewers, so make sure your repository's visibility is set to Public before you submit.
- 2 Share your repository link.** You will be given a Google form link on the hackathon Slack channel, where you can upload your public GitHub repository link. This is how the reviewers will find and review your project.
- 3 Make sure your repository contains all your code.** The repository must include everything you wrote during the hackathon: all code, no partial uploads or code left only on someone's local machine. Make sure you push all your branches to main.
- 4 Make sure your submission contains the requirements from AI guidelines for hackathons.** The 'AI guidelines for hackathons' require some extra files and folders to be submitted, disclosing AI usage.

2

Step

11:00 – 12:00

Technical mentors begin code review

Technical mentors move to the mentors room. All in one room so they can discuss if there are questions. They review each team's repository directly.

3

Step

11:00 – 12:00 · in parallel with code review

Demo review

While technical mentors review code, other technical team members, especially Spanish-speaking collaborators, review each team's demo video, checking that it shows a payment made through Open Payments end to end: payment initiation, the authorization (consent) step and a successful completion.

The Demo videos will need to be uploaded either in your public GitHub repository, or in a Google Drive (the link will be sent in the hackathon Slack channel). This is because every presentation room will use only one laptop.

4

Step

11:00 – 12:00 · in parallel

Presentation deck review

The same Spanish-speaking collaborators also help review teams' presentation decks alongside the demo review.

The presentations will need to be uploaded either in your public GitHub repository, or in a Google Drive (the link will be sent in the hackathon Slack channel). This is because every presentation room will use only one laptop.

5

Step

12:00

Uploads close at 12:00

All demo videos and presentation decks must be uploaded to your public GitHub repository or to a Google Drive by 12:00, ahead of Round 1 judging session.

02

AI POLICY FOR HACKATHONS➤

AI Usage Policy for Hackathon Participants

In this part >

AI tools are allowed	8
Disclosure is required	8
Example: AI_USAGE.md	9
Prompt logs, recommendation and preparation	10

1

AI Tools Are Allowed

Participants are welcome to use AI tools (e.g., ChatGPT, Claude, GitHub Copilot, Cursor, Gemini, etc.) throughout the hackathon. AI can be used for coding frontend and backend, debugging, research, design, or document writing if needed for the hackathon.

2

Disclosure Is Required

Every team must add a file named `AI_USAGE.md` to the root of their GitHub project repository. This file must state:

- › Which AI tool(s) were used
- › What they were used for
- › Where in the project they were used (specific files, features, or components), or mention the whole project, if no file was written without AI
- › Specify specific files, where minimal or no AI was used, for example the Open Payments service file

Required in every repository

`AI_USAGE.md`

`/prompts`

Example: AI_USAGE.md

AI_USAGE.md

AI Usage Disclosure

Tools Used

- ChatGPT (GPT-4o)
- Claude

Where and How We Used AI

1. Backend - Payment flow (`/src/api/open-payments.ts`)

- Used Claude to scaffold the initial Open Payments flow, creating incoming and outgoing payments, as well as quote creation.
- Reviewed and rewrote error handling ourselves after testing revealed the AI's version didn't handle grants correctly.

2. Frontend - Donation platform UI (`/src/components/Donation.tsx`)

- Used Claude to generate all design and frontend pages and components

3. Documentation - README setup instructions

- Used ChatGPT to draft the initial README structure.
- Edited by hand to match our actual setup steps and fix inaccurate install commands.

What We Did Ourselves

- Testing and verification of all AI-suggested code

Prompt Log

See `/prompts/backend-payments.md` for the full list of prompts used to generate the open payments flow code.

3

Prompt Logs Are Required

Teams must also push the prompts they used to instruct AI tools for coding into their repo, in a folder called `/prompts` (or appended to `AI_USAGE.md` if the log is short). This should include the actual prompt text sent to the AI, not just a summary. All AI tools used should be able to provide a prompt list to be saved in the folder/file.

Example: `/prompts/backend-payments.md`

4

Recommendation: Use AI, But Don't Outsource Your Work Or Your Thinking

Work with it, don't make it work instead of you. AI usage is fully permitted and encouraged as a productivity tool. That said, we strongly encourage participants not to outsource the entire project to AI. Hackathons are meant to build your own skills and judgment; the value is in your understanding of what you built, not in how much AI wrote for you.

Trust, but verify. Always review, test, and understand any code or content AI gives you before shipping it. AI-generated code can be subtly wrong, insecure, or based on outdated APIs, or not even Interledger Open Payments API. You are responsible for what's in your repo, regardless of who (or what) wrote it.

5

Required Open Payments Preparation

Before the hackathon (or before submitting), all participants must complete one of the following:

- › [The Platzi course on Open Payments](#) (Spanish only), or
- › Review the Hackathon Survival Guide (English and Spanish)

A solid understanding of the Open Payments flow is required before building on it, and this preparation ensures every participant has that foundation.

Platzi course
